Institut de physique du globe de Paris

Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, July 19, 2024, 16:00 local time (GMT-4)

Volcanic activity has remained low this week with **3 volcanic earthquakes** observed.

Between July 12, 2024 at 16:00 (UTC) and July 19, 2024 at 16:00 (UTC), the OVSM has recorded **3** very low-energy **volcano-tectonic** type earthquakes. They were originating probably from one of the well-known seismically active zones on Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since late 2018.

No earthquake was felt by the population.

The week before, the OVSM had recorded **2 earthquakes** of volcanic origin. As of July 19, and during the last 4 weeks, the OVSM recorded a total of 6 volcanic earthquakes, and an average of **1 to 2 volcanic earthquakes** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity that varies over time in intensity and frequency.

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level is currently YELLOW: vigilance.

The Director's office of OVSM-IPGP.
