Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, September 6, 2024, 16:00 local time (GMT-4)

Volcanic activity has slightly increased this week with **16 volcanic earthquakes** observed.

Between August 30, 2024 at 16:00 (UTC) and September 6, 2024 at 16:00 (UTC), the OVSM has recorded **16** low-energy **volcano-tectonic** type earthquakes. One of these earthquakes was located around 6km east of the volcano summit at about 3km depth. The other 15 earthquakes were clearly identified as originating from one of the well-known seismically active zones on Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since late 2018.

No earthquake was felt by the population.

The week before, the OVSM had recorded **0 earthquake** of volcanic origin. As of September 6, and during the last 4 weeks, the OVSM recorded a total of 29 volcanic earthquakes, and an average of **7 to 8 volcanic earthquakes** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity that varies over time in intensity and frequency.

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level is currently YELLOW: vigilance.

The Director's office of OVSM-IPGP.
