Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, November 15, 2024, 16:30 local time (GMT-4)

Volcanic activity is stable in number this week, with **13 volcanic earthquakes** observed.

Between November 8, 2024 at 16:00 (UTC) and November 15, 2024 at 16:00 (UTC), the OVSM has recorded:

- **12** low-energy **volcano-tectonic** type earthquakes. These earthquakes were clearly identified as originating from one of the well-known seismically active zones on Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since late 2018.
- **1 long-period** type earthquake of moderate energy (magnitude $M_l=1.4$) located at around 32 km depth and at around 8km to the southeast of Mont Pelée. Deep long-period events contain only low frequencies and are associated with the presence of magmatic fluids deep within the Mont Pelée volcanic system.

No earthquake was felt by the population.

The week before, the OVSM had recorded **11 earthquakes** of volcanic origin. As of November 15, and during the last 4 weeks, the OVSM recorded a total of 39 volcanic earthquakes, and an average of **9 to 10 volcanic earthquakes** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity that varies over time in intensity and frequency.

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level is currently YELLOW: vigilance.

The Director's office of OVSM-IPGP.
