Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, February 21, 2025, 14:15 local time (GMT-4)

Volcanic activity remains low this week, with **1 volcanic earthquake** observed.

Between February 14, 2025 at 16:00 (UTC) and February 21, 2025 at 16:00 (UTC), the OVSM has recorded **1** low-energy **volcano-tectonic** type earthquake. This earthquake was clearly identified as originating from one of the well-known seismically active zones on Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since late 2018.

This earthquake was not felt by the population.

The week before, the OVSM had recorded **1 earthquake** of volcanic origin. As of February 21, and during the last 4 weeks, the OVSM recorded a total of 2 volcanic earthquakes, and an average of **0 to 1 volcanic earthquake** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity that varies over time in intensity and frequency.

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level is currently YELLOW: vigilance.

The Director's office of OVSM-IPGP.

Informations

The data in this report are preliminary and subject to change depending on their subsequent analysis.

The reports of OVSM-IPGP, including detailed monthly bulletins, are available at
