Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, March 28, 2025, 17:00 local time (GMT-4)

Volcanic activity has decreased in number this week, with **3 volcanic earthquakes** observed.

Between March 21, 2025 at 16:00 (UTC) and March 28, 2025 at 16:00 (UTC), the OVSM has recorded :

- **1 low-energy volcano-tectonic** type earthquake. This earthquake was clearly identified as originating from one of the well-known seismically active zones on Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since late 2018.
- **2 long-period** type earthquakes of magnitude $M_{lv}=1.1$ and $M_{lv}=1.0$ both located at around 28 km depth to the southeast of Mont Pelée. Deep long-period events contain only low frequencies and are associated with the presence of magmatic fluids deep within the Mont Pelée volcanic system.

No earthquake was felt by the population.

The week before, the OVSM had recorded **221 earthquakes** of volcanic origin. As of March 28, and during the last 4 weeks, the OVSM recorded a total of 269 volcanic earthquakes, and an average of **67 to 68 volcanic earthquakes** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity that varies over time in intensity and frequency.

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level is currently YELLOW: vigilance.

The Director's office of OVSM-IPGP.

Informations

The data in this report are preliminary and subject to change depending on their subsequent analysis.

The reports of OVSM-IPGP, including detailed monthly bulletins, are available at
