Institut de physique du globe de Paris

Observatoire volcanologique et sismologique de Martinique

Activity of Mount Pelée

Saint-Pierre, November 28, 2025, 16:00 local time (GMT-4)

Volcanic activity has decreased this week by **18 volcanic earthquakes** observed.

Between November 21, 2025 at 16:00 (UTC) and November 28, 2025 at 16:00 (UTC), the OVSM has recorded:

- **15 shallow volcano-tectonic** type earthquakes. Among them, 2 have a magnitude (duration magnitude M_d or local magnitude M_{lv}) greater than 0,5. The largest have a magnitude **$M_{lv} = 1,42$** . The others are of lower energy. These earthquakes originate from well-known seismically active zones at Mount Pelée, located between 1.0 and 1.4 km below the summit of the volcano. Superficial volcano-tectonic seismicity is associated with micro-fracturing in the volcanic edifice related to the overall reactivation of the volcano observed since 2019.
- **3 shallow hybrid** type earthquakes of low energy. They originated in the same area as the shallow volcano-tectonic earthquakes. Shallow hybrid earthquakes have signals enriched in low frequencies and are associated with the circulation of fluids (gas, hydrothermal fluids) in the volcanic edifice.

No earthquake was felt by the population.

The week before, the OVSM had recorded **235 earthquakes** of volcanic origin. As of November 28, and during the last 4 weeks, the OVSM recorded a total of 439 volcanic earthquakes, and an average of **109 to 110 volcanic earthquakes** per week.

During phases of volcanic unrest on volcanoes similar to Mount Pelée, it is usual to observe seismic activity variable in intensity and frequency. The probability of eruptive activity in the short term remains low. However, given all the observations collected since the end of 2018 and their nature, and based on the recent observations of the OVSM-IPGP, we cannot exclude a medium-term evolution of the situation (weeks, months).

For more details on longer-term observations and interpretations of volcanic activity, please refer to the monthly bulletins of the OVSM.

The alert level, in accordance with the provisions planned by the authorities, is currently YELLOW: vigilance

The Director's office of OVSM-IPGP.

Informations

The data in this report are preliminary and subject to change depending on their subsequent analysis.

The reports of OVSM-IPGP, including detailed monthly bulletins, are available at <https://www.ipgp.fr/observation/ovs/ovsm/>.

You can also find us on our [Bluesky](#) et [Facebook](#) accounts. Locations of volcano-tectonic and tectonic earthquakes determined by the OVSM-IPGP are available in real-time at <https://renass.unistra.fr/fr/zones/les-antilles/>.
